

Technical Note

(TcpMDT_en_v75_utl004_Import_Hexagon)

Importing surveys in Hexagon XML format to MDT

Update Date

26/07/2016

Requirements

MDT Versions: 7.5 or higher

CAD Versions: All supported

Operating Systems: Windows XP / 7 / 8 / 10

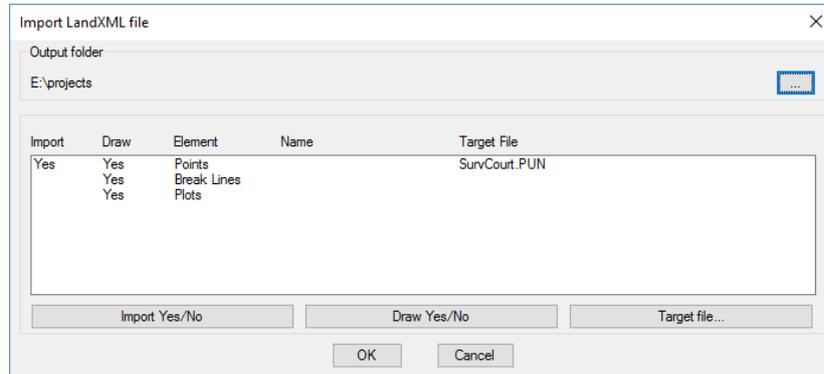

Objective

In this technical note the procedure for importing an hexagon XML file in MDT 7.5 is described. This tool will convert automatically **points, breaklines and parcels** recorded in selected file.

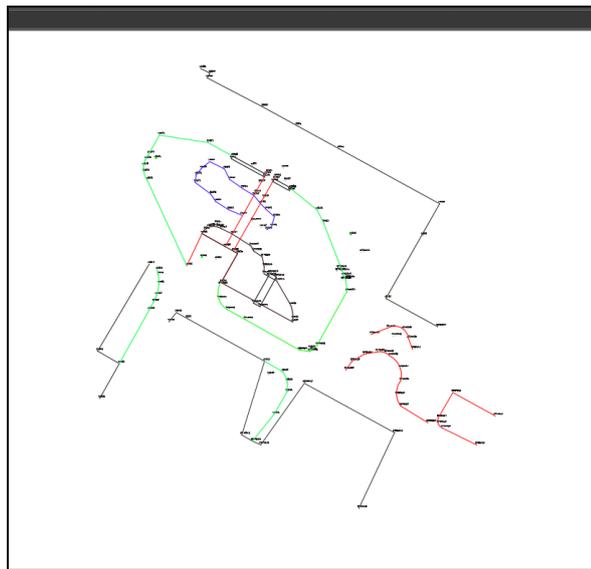

Breaklines will be imported as polylines drawn in their respective layers, so that they can be used for creating the surface.

Importing an Hexagon XML file to MDT v 7.5

1. Run MDT command “*Utilities > Import LandXML*” and select Hexagon XML file. In this case we select file *SurvCourt.xml*.
2. Then the elements of file will be shown in the following dialog.

3. By pressing “**Import Yes/No**” we can enable for “**Points**” the creation of a point file. This point file can be chosen with “**Output file ...**” button. Now we select as point file “*SurvCourt,pun*”.
4. The button “**Draw Yes/No**” can be used to enable or disable the drawing of each of the elements. By default all elements will be drawn.
5. Finally we must press “**OK**” button and selected elements will be represented automatically.
